Lecture Overview

- Introduce Source Control
 - Look at GIT

- Look at Software Quality Standards

- Readable Code
 - Commenting

- Reference Material for Lecture

- Java Style Programming Guidelines

What is Source Code Control?

- Sometimes called version control or source code control - is the management of changes to documents, computer programs, large web sites, and other collections of information.

- Changes are usually termed the "revision number," "revision," or "revision." <https://eduassistpro.github.io/>

What is the purpose of using a Version Control System

- Version control systems (VCS) most commonly run as stand-alone applications, but revision control is also embedded in various types of software such as word processors and spreadsheets.
- Revision control documents a previous revision, which allows editors to track each other's mistakes, and defend against vandalism.

History of Source Code Control Systems for Software

Generation	Networking	Operations	Concurrency	Examples
First	None	One file at a time	Locks	SCCS – 1972 RCS – 1980
Second	Centralized (Requires connection)	Multi-file	merge edit	CVS - 1986, SourceSafe - 1994 , SVN - 2000 , Team Foundation Server - 2005
Third	Distributed (Local and remote repository support)	Changesets	Commit before merge	Bazaar - 2005 , Git - 2005, Mercurial - 2005

Example

Git – Key Terminology

- **Git** - is command line client software that supports access to both local and remote repositories.
- **GitHub** - is a Web-based Git repository hosting service.
- **Repo** – Acronyms that are grouped together

Git – Key Commands

- **Init** – Creates a Git repo.
- **Add** – adds in files
- **Commit** – The es to the repo.
<https://eduassistpro.github.io/>
- **Clone** – clones a repo in a new dire or starting a new branch from a remote

- **Checkout** – switches branches
- **Merge** – merges changes back to the head

Programming Guideline

- A document that describes best practices for a particular programming language or technology

Assignment Project Exam Help

- Guides a programmer to produce a program that can easily be understood in a particular programming language or technology

- Many companies have internal programming guideline documents for their programmers
- Some guidelines are standard to a language
 - Think of your Documentation Standards document from COMP 10062 – Programming in Java

Why is a Programming Guideline useful?

- Naming
- General Readability
- Statement Order
 - example : location of declaration of variables
 - at top of a block
- General program
 - Positive vs. Negative logic, which lo is best suited to a particular task.
- Comments
 - In-line, To support automated documentation
- Minimized duplication
 - Code is refactored into Classes/Functions to maximize re-use!

Code Review

- Peer Review

- General informal review process, where the code is viewed by another programmer
- Usually a more senior programmer will do this review.

- Walkthrough

- More systematic
- Typically done by a group
- Will code meet required specification.
 - Did some aspect of the specification get missed or misunderstood?

- Inspections

- Fairly formal – review of application of standard / specific guidelines
- Typically done on systems that impact human safety
 - Nuclear reactor, space shuttle

Code Review – What you are looking for?

- Data Reference Errors
 - Is the correct variable being used?

- Data Declaration Errors

- Is the correct type used?
- In many cases it is difficult to detect problems with data type mismatches
- This can be an issue in loose type programming languages (e.g. PHP / Javascript)

Code Review – What you are looking for?

- Computation Errors – Is the calculation correct
 - Need to verify with another method
 - Hand, Calculator, A separate application
- Comparison
 - Are all conditions
 - Need to be careful when creating condition expression and when using negation
- Control of Flow
 - Loop entry and exit
 - Are entry and exit conditions for flow control set correctly

Code Review – What you are looking for?

- Parameter Errors
 - Are the parameters used within a function call correctly specified
 - Is there a verification of the values – range checking
- Input / Output
 - Are the data input / outputs matched to variables.

Code Reviews are useful for many reasons, but are not a replacement for Formalized Testing

Commenting

- Types of Comments:

1. Overall Descriptive
2. Code Explanation
3. Document

Overall Comments

- Description of what the module / component accomplishes or does from a high level
- Typically at the top of a module
- For example, in comment

Code Explanation Comments

- Details on “non-trivial” code that may be unclear to a junior level programmer within that environment.

- Not intended to comment every line of code

- Well-written code <https://eduassistpro.github.io/>

- Sometimes it is important to document, bug-fixes
