What is a Software Specification?

- A Software Specification is a description of the correct operation of an application

- Can be provided as a *list of requirements*

- The specification describes the product.

- How can requirements be written to be testable?

- <http://www.cqaa.org/Resources/Documents/Presentations%202010/Writing%20Testable%20Requirements.pdf>

Specification and Documentation Testing

- Why does a specification need to be tested?
 - First chance for review
 - TEST before CODING - Finding bugs at this stage is the most cost effective.
 - Used to reveal
 - Good time to understand the scope and requirement the developer n.
- This is referred to as Static black-box
 - No code exists at this point in the development
 - It is good practice to have clients provide the review.

Specification and Documentation Testing

- Three ways to evaluate the specification in order to provide a high-level review.
 - Put yourself in the place of the customer
 - Research existing product to the platform being
 - Review and test
 - Not always possible, but often applications can be used to clarify functionality.

What to ask during Specification Review?

- Is it Complete and Accurate?
- Is it Consistent?
 - Are the terms and nomenclature the same throughout the document
- Is the information presented important to the development of THIS application.
 - Extra information can be a distraction. Keep the specification focused.

What to ask during Specification Review?

- Is it Feasible?
 - Can it be built with current hardware / software
- Is the specification code/technology free?
 - Should not specify requirements.
- Can the Specification be tested?
 - Is it complete and specific enough to rate use cases. The use cases can be used to generate specific test cases.
